PROJECT PROPOSAL

HR Management *System*

A basic web application where HR manages employees, attendance, leave and monthly salary, and employees see their own records online.

PHP · MySQL · HTML · CSS · JavaScript

SUBMITTED BY

Name _____

ID _____

Batch / Course _____

Date November 2026

PROJECT IDEA

The problem it solves

The problem

- Employee records are kept on paper or in many spreadsheets
- Attendance and leave are counted by hand, so mistakes happen
- Monthly salary takes a lot of time to calculate and check

My solution

- One website where all HR data is in one place
- Employees check in, apply for leave and see their payslip online
- Salary is worked out automatically from attendance and leave

Goal: make managing people and salary simple, fast and clear.

THE PROJECT

Three types of users

Admin

- Creates HR and employee accounts
- Manages departments and leave types
- Sets holidays and views all reports

HR Manager

- Adds and updates employee records
- Approves or rejects leave requests
- Generates monthly payroll

Employee

- Checks in and checks out each day
- Applies for leave and sees the balance
- Views own payslip and profile

PROJECT IDEA

How it works in three steps

Employee

1. Log in with own account
2. Check in and apply for leave
3. See attendance and payslip

HR Manager

1. Add the employee profile
2. Approve leave, check attendance
3. Generate and pay the salary

PROJECT IDEA

Everything HR needs on one dashboard

Dashboard Sample data

48	41	4	3
Employees	Present today	On leave	Pending requests

Filter by: Department · Designation · Month · Status · Date

- Late check-ins are marked
- Leave balance updates after approval
- Payslips can be printed

MAIN PAGES

Six pages the system will have

Dashboard
Totals and today's summary

Employees
Add, search and update

Attendance
Daily check-in and report

Leave
Apply, approve, balance

Payroll
Salary and payslips

Reports
Monthly summaries

These pages follow the usual features of a small-company HR system. The database below is designed to support every one of them.

DATABASE STRUCTURE

12 tables in 6 groups

Users & profiles
`users`
`employees`

Lookup lists
`departments`
`designations`
`leave_types`
`holidays`

Attendance
`attendance`

Leave
`leave_balances`
`leave_requests`

Payroll
`salary_structures`
`payroll`

Alerts
`notifications`

12
tables in total

PAYROLL

Payroll: make a payslip inside the site

1
Set the salary
Basic salary and allowances
`salary_structures`

2
Count attendance
Present, absent and leave days
`attendance`
`leave_requests`

3
Apply deductions
Absent days and fixed cuts
`payroll`

4
Make the payslip
Save the month and print it
`payroll.status`

FROM TABLES TO PAYSLIP

Every part of the payslip comes from a table

Karim Hossain — Payslip
Junior PHP Developer · IT Department — October 2026

EMPLOYEE	employees, departments
Employee code	EMP-0012
Joined	March 2025
ATTENDANCE	attendance
Working days	26
Present	24
Absent (no leave)	2
EARNINGS	salary_structures
Basic salary	20,000
House rent	6,000
Medical	1,000
Conveyance	1,000
Gross salary	**28,000**
DEDUCTIONS	payroll
Absent days (2)	1,333
Provident fund	500
Total deductions	**1,833**

NET SALARY — **Tk 26,167**

One structure, many months
The salary structure is saved once in salary_structures. Every month a new row is added to payroll.

Rules set by HR
Absent deduction = basic ÷ 30 × absent days. Approved leave is never deducted.

The payslip is kept
When payroll is generated, the amounts are copied into payroll, so an old payslip never changes if salary changes later.

Sample data. Payroll adds only 2 tables: **salary_structures** and **payroll.**

GROUP 1

Users and profiles

Table	What it stores	Linked to
`users`	Login details of every user: admin, HR manager or employee	-
`employees`	Profile of an employee: code, phone, join date, status	`users, departments, designations`

Key idea:
everyone logs in from one users table. The role column says who they are, and the details of an employee are kept in employees.

GROUP 2

Lookup lists

Table	What it stores	Linked to
`departments`	Department names, such as IT or Sales	`employees`
`designations`	Job titles, such as Developer or Manager	`employees`
`leave_types`	Kinds of leave and days per year: casual, sick, annual	`leave_balances, leave_requests`
`holidays`	Public holidays, skipped when counting work days	-

The admin manages these four lists. Other tables only store the id of a row from a list, so a name is changed in one place and updated everywhere.

GROUPS 3 AND 4

Attendance and leave

Table	What it stores	Linked to
`attendance`	One row per employee per day: check-in, check-out, status	`employees`
`leave_balances`	Days left of each leave type, for each year	`employees, leave_types`
`leave_requests`	Each leave application: dates, reason and status	`employees, leave_types, users`

Attendance status: present · late · absent · on_leave

Leave status: pending · approved · rejected · cancelled

GROUPS 5 AND 6

Payroll and notifications

Table	What it stores	Linked to
`salary_structures`	Basic salary and allowances of an employee	`employees`
`payroll`	Monthly salary: gross, deductions, net and status	`employees`
`notifications`	Messages like “Your leave is approved”	`users`

RELATIONSHIPS

Three ways the tables connect

One to one

users → employees

One employee profile belongs to exactly one login account.

One to many

departments → employees

employees → attendance

One department has many employees. One employee has many attendance rows.

Many to many

employees ↔ leave_types via leave_balances

An employee can have many leave types, and a leave type is used by many employees. A middle table joins them.

Tables are joined with a **foreign key**: a column that stores the id of a row in another table, such as employees.department_id.

SALARY FLOW

How monthly salary is paid

1

Generate payroll

A new row in payroll

draft

→

2

HR checks it

Attendance and leave are reviewed

approved

→

3

Salary is paid

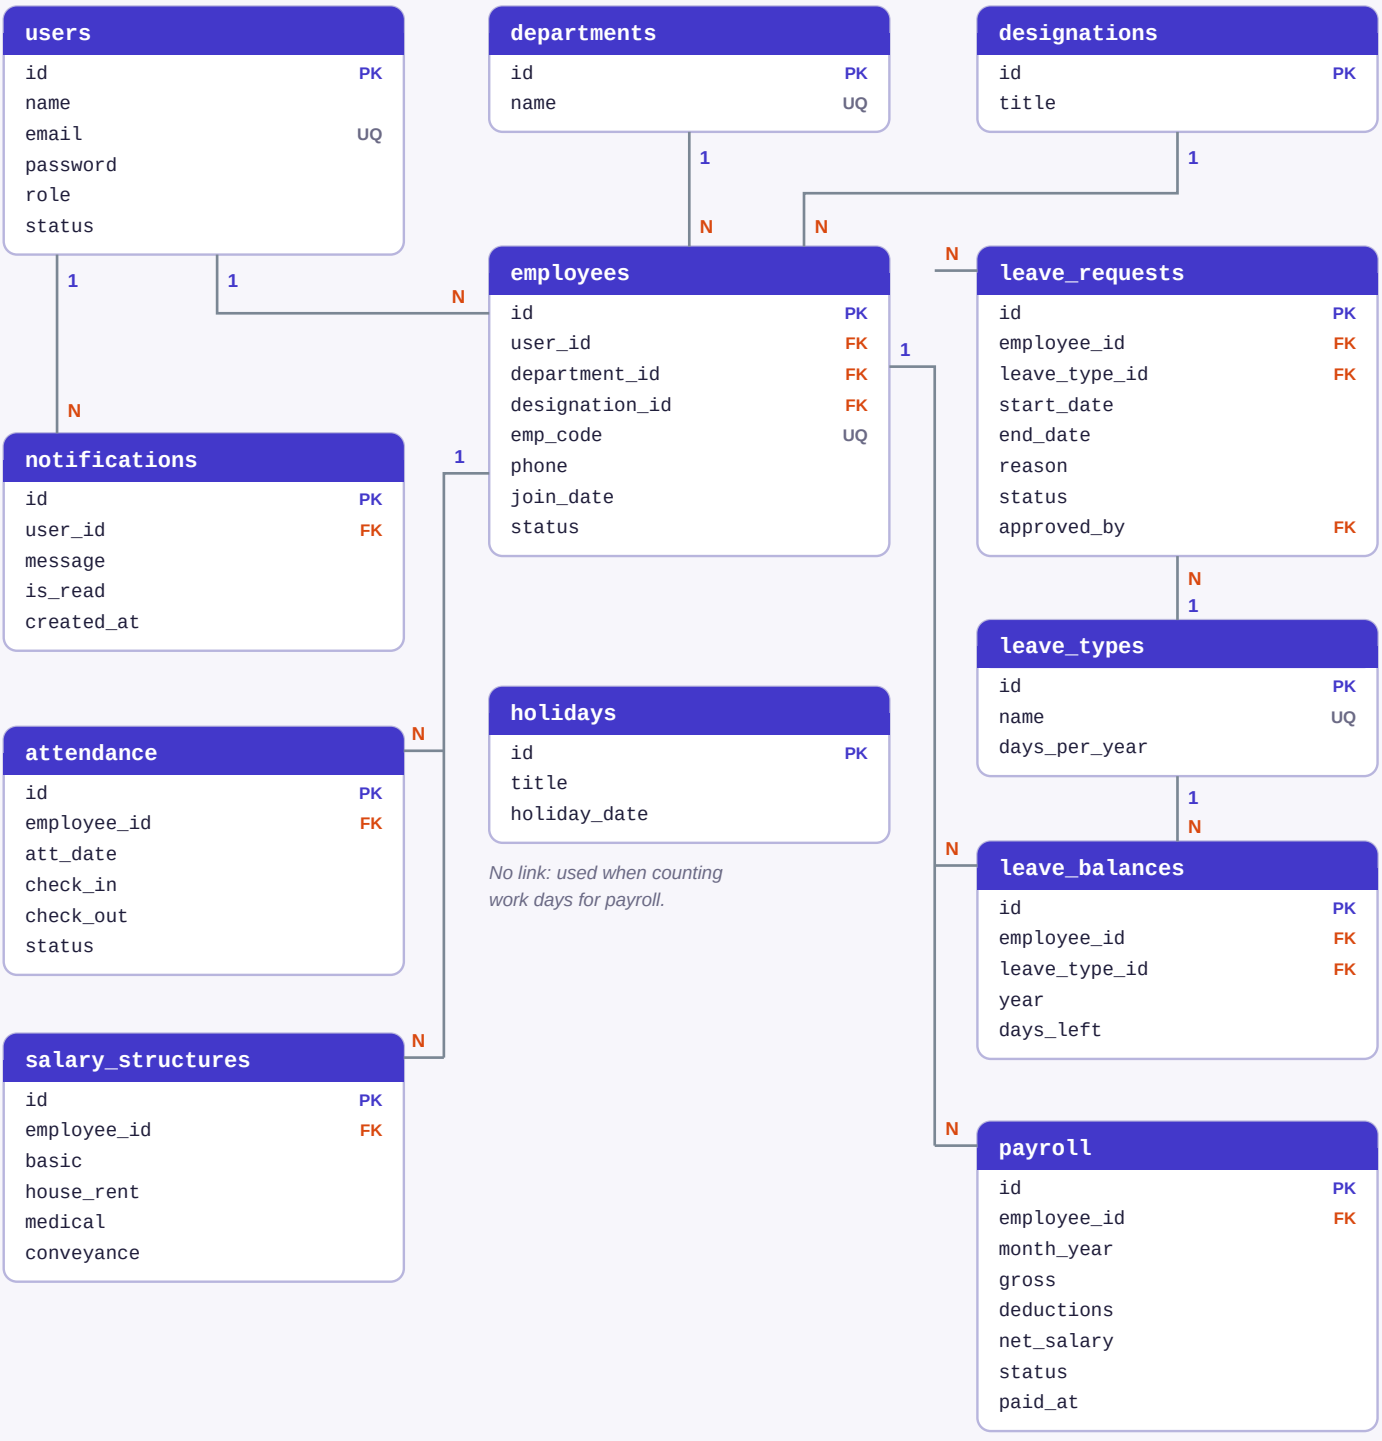
The month is marked as done

paid

Each employee gets one payroll row per month. The same month cannot be generated twice for the same employee.

DATABASE DIAGRAM

ERD: all 12 tables



PK, FK = primary key, FK = foreign key, UQ = unique. Each line goes from a foreign key (N side) to the id it points to (1 side). leave_requests.approved_by also points to users.id; that line is not drawn to keep the picture clear.

TOOLS

Technology it will be built with

Frontend

HTML
CSS
JavaScript
Bootstrap

Backend

PHP
No framework
Sessions for login

Database

MySQL
phpMyAdmin

Server

Apache
XAMPP
Git

THE PLAN

Eight weeks, one module at a time

Week 1	Requirements, database design, project setup
Week 2	Login and role-based access
Week 3	Employee management
Week 4	Daily attendance
Week 5	Leave management
Week 6	Payroll and payslip
Week 7	Dashboard and reports
Week 8	Testing, bug fixing, documentation

Not in this version

Recruitment · Biometric devices · Mobile app · Performance reviews

These can be added later without changing the 12 tables above.

PROJECT IDEA

Ideas for the future

Email alerts

Send leave and payslip alerts by email

Biometric attendance

Connect a fingerprint or RFID device

Mobile app

Check in and apply for leave from a phone

Bangla and English

Let users choose the language of the website

SUMMARY

Simple, linked and safe

12
tables in 6 groups

3
user roles in one login table

4
modules: employees, attendance, leave, payroll

- One attendance row per employee per day
- One payroll row per employee per month
- Passwords are saved as secure hashes
- Deleting a user also removes their profile
